Traditional and Novel Predictors of Early Cardiovascular Disease Risk in HIV Infected and non-HIV Infected Rwandans
Aims are to:
1) Identify traditional (age, sex, family history of CVD, systolic blood pressure, smoking, total & HDL cholesterol, & diabetes) and novel (inflammatory & immune activation) CVD risk factors in two groups: individuals with HIV and age and sex matched individuals without HIV; 2) Determine if specific inflammatory (IL-6, TNF-a, CRP, d-dimer) and immune (TSH, T4, CD4+) factors are associated with cardiovascular risk scores (low, moderate, or high risk) in two groups and 3) Determine if psychosocial factors are associated with CVD risk and if factors vary by sex and HIV status.
