A Randomized Controlled Trial to Reduce Hopelessness through Enhanced Physical Activity in Adults with Ischemic Heart Disease

Aims: 1) Test the effectiveness of 6 weeks of motivational social support (MSS) from a nurse and MSS with additional social support from a significant other (SOS) on increasing mean minutes per day of moderate to vigorous physical activity (PA); 2) Determine the effects of change in minutes per day of moderate to vigorous PA on state hopelessness; and 3) Determine if social support and motivation mediate the effects of the intervention on PA.
